Robotic Scanning for Error-Free Warehouses

Viziotix and doks. innovation join forces for warehouse automation

Toulouse, France: Viziotix today announced a new partnership with doks. innovation. This partnership will accelerate the digitization of the warehouse with automatic robotic inventory counting.

"By partnering with doks. Innovation, we are leading the transformation and digitization of the warehouse and distribution center," says Cedric Mollon, Co-Founder and CEO at Viziotix. "Our software enables the scanning of pallet and rack barcode labels using cameras integrated into robotic applications and we have overcome the challenges of distance, lighting and movement blur to make this possible."

"We chose Viziotix for our automated inventory management solution inventairy. Our thorough competitive analysis showed Viziotix software outperforms the other solutions available on the market today both in terms of reading rate and speed," says Mike Becker, Co-Founder and Head of Software Development at doks. innovation. "Going forward, we believe that our robotic drone solution, inventairy, and Viziotix software, makes for a powerful solution for the digitization of logistics."

The benefits of this new partnership include.

- Lower warehouse costs to replace manual cycle and wall-to-wall stock counts
- A complete, continuously updated and accurate inventory for the error-free warehouse
- Better customer service and delivery times
- Further automation in logistics as both Viziotix and doks. innovation develop new products and features

About Viziotix SAS: Viziotix, a French start-up, is developing Computer-Vision software to acquire data from images that will allow companies to build solutions that automate and improve the efficiency of their operations. The Viziotix Barcode Scanner SDK provides efficient and robust barcode scanning on images acquired from any camera for enterprise applications including fixed cameras, robots and drones.

About doks. Innovation GmbH: doks. innovation accelerates the digitization of stocktaking and inventory processes, the management of master data as well as the transportation of goods over short distances. The automated, robotic solutions are based on years of research and development and unite machine and deep learning, artificial intelligence and automation approaches.
